

Easy

Add another quiz type for region.

In the CountryTableViewController, add a view where you can sort by region and subregion.

Make another view for high scores (link from MainMenuViewController) and list top 10 (or more) high scores and the user's names.

Store scores by quiz type on parse.

Weight scores based on quiz type. Population is hard (should weigh more), subregion is easy etc.

Resize flag image views based on actual flag size (as it is loaded). The flags are shown in the InfoViewController and the QuizViewController

Medium

Post score to Facebook or Twitter.

Add another quiz type for bordering countries. EX: Which country does this country border? Or which country does this country not border?

Add a "hard mode" where all quiz types are now answered by typing the answer.

Add a "Learn more" link on the InfoViewController that links to Wikipedia or another website about the country.

Hard

Add a switch on the InfoViewController and a Boolean to Country.m where a user can mark if they learned the country or not. Store learned countries to parse, and fetch the data when loading too.

Dependent on the previous task: add a quiz field on the QuizMenuViewController that will quiz randomly, but only on countries marked as "learned".
